

# Predicting Frictional Properties of Graphene Kirigami Using Molecular Dynamics and Neural Networks

Designs for a negative friction coefficient

Mikkel Metzsch Jensen

University of Oslo

Juni 02, 2023

UiO : Department of Physics  
University of Oslo

# Outline

## ① Introduction

Thesis overview

Motivation

System setup

## ② Creating a graphene Kirigami system

Kirigami

## ③ Pilot study

Friction metrics

Out-of-plane buckling

Friction-strain profiles

Negative friction coefficient

## ④ Kirigami configuration search

Machine learning

Accelerated search

## ⑤ Summary and outlook

# Thesis overview

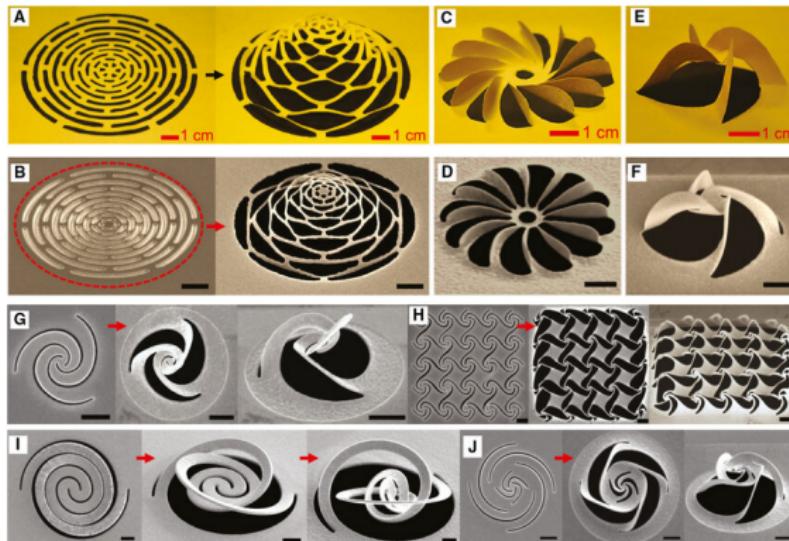

- ① **Sheet kirigami:** Alter a graphene sheet using atomic scale cuts and stretching
- ② **Forward simulation:** Calculate the frictional properties of the sheet using MD simulations
- ③ **Accelerated search:** Use machine learning to replace the MD simulations and perform an accelerated search for new designs

Can we control the friction of a nanoscale Kirigami sheet through pattern design and straining of the sheet?

Can we control the friction of a nanoscale Kirigami sheet through pattern design and straining of the sheet?

# Motivation

- Kirigami: Variation of origami with cuts permitted
- Designs: Macroscale → nanoscale

**Figure:** Example of macroscale Kirigami designs implemented on a nanoscale using a focused ion beam (FIB). Black scale bars:  $1 \mu\text{m}$ . Reproduced from [1].

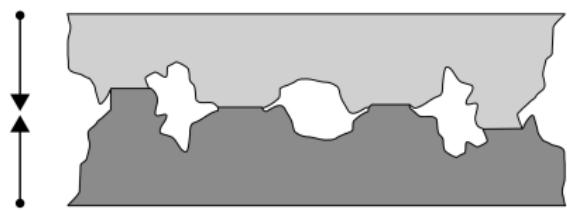

# Motivation

## Out-of-plane buckling

- Hanakata et al. [2, 3] found out-of-plane buckling with Kirigami designs
- Surface properties are predicted to be important for friction properties
  - Asperity theory: Contact area
  - Frenkel–Kontorova models: Commensurability

(a) Small load.

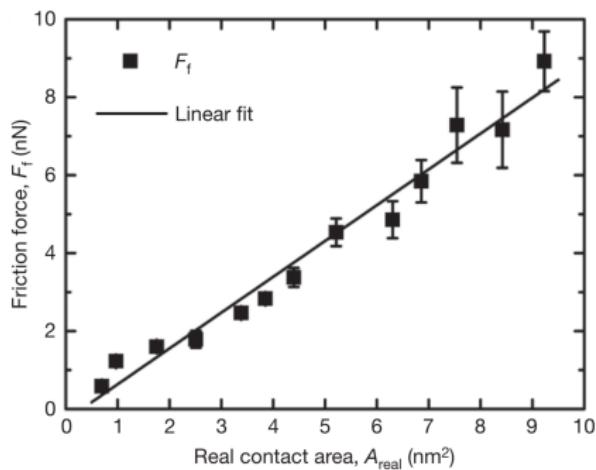

(b) High load.

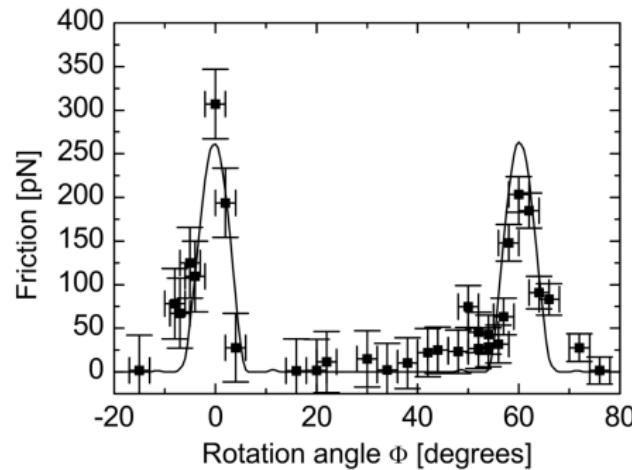

Figure: Reproduced from [4].

# Motivation

Contact area and commensurability

(a) Numerical MD results using an amorphous carbon tip and a diamond sample. Reproduced from [5] with permission from the Springer Nature.

(b) Experimental results of a graphene sheet sliding on graphite. Adapted from [6], reproduced from [7] with permission from the American Physical Society.

Accelerated search

## ⑤ Summary and outlook

# Creating a graphene Kirigami system

## System setup

**Figure:** Graphene sheet on a silicon substrate. Blue: Substrate, Red: Inner sheet, Grey: Pull blocks.

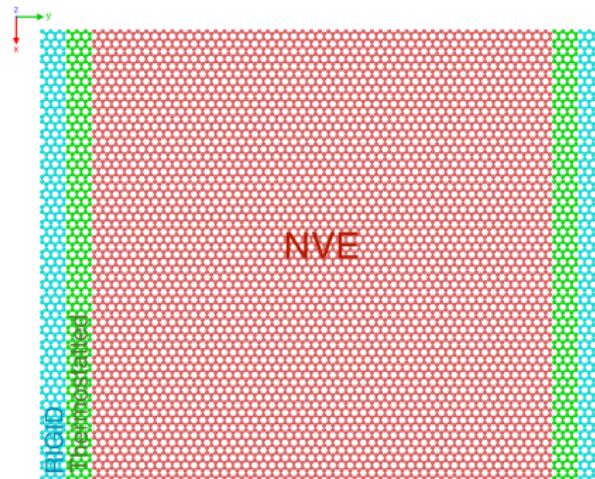

# Creating a graphene Kirigami system

## System setup

System size = ???

(a) Side view.

(b) Top view.

# Creating a graphene Kirigami system

## Sheet Kirigami

Primitive lattice vectors

$$\mathbf{a}_1 = a \left( \frac{\sqrt{3}}{2}, -\frac{1}{2} \right) \quad \mathbf{a}_2 = a \left( \frac{\sqrt{3}}{2}, \frac{1}{2} \right), \quad |\mathbf{a}_1| = |\mathbf{a}_2| = a = 2.46 \text{ \AA}.$$

Basis

$$\left\{ (0,0), \frac{a}{2} \left( \frac{1}{\sqrt{3}}, 1 \right) \right\}.$$

Interatomic distance

$$\left\| \frac{a}{2} \left( \frac{1}{\sqrt{3}}, 1 \right) \right\| \approx 1.42 \text{ \AA}.$$

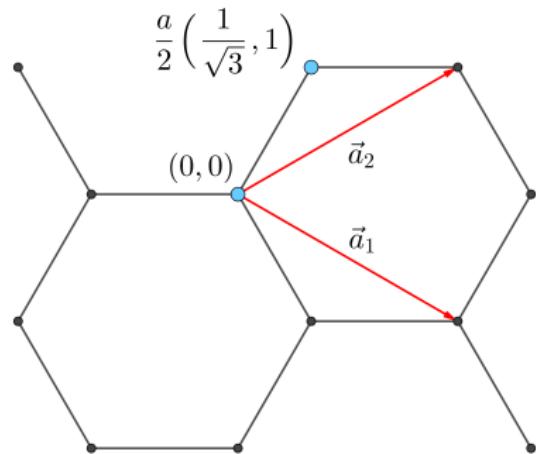

Figure: Graphene crystal structure.

## Sheet Kirigami

### Random walk

# Creating a graphene Kirigami system

MD simulation

Integration. Newtons equation (NVE)

$$m_i \frac{d^2 \mathbf{r}_i}{dt^2} = \mathbf{F}_i = -\nabla U_i,$$

Introducing the temperature (canonical ensemble: NVT) with the Langevin equation

$$m_i \frac{d^2 \mathbf{r}_i}{dt^2} = \underbrace{-\nabla U_i}_{F_i} \underbrace{-\alpha \mathbf{v}_i}_{\text{Drag}} + \underbrace{\mathbf{R}_i}_{\text{Fluctuation}},$$

$$\langle R \rangle = 0, \quad \langle R^2 \rangle = 2\alpha k_B T.$$

### Properties of interest

$\min F_{\text{fric}}$ ,

$\max F_{\text{fric}}$ ,

$\max \Delta F_{\text{fric}}$ ,

$\max \text{drop}$ .

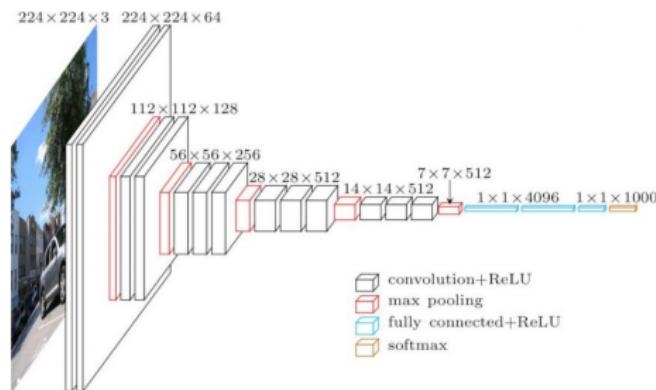

**Figure:** Max drop property. Best candidates in the dataset.

# Kirigami configuration search

ML

- Convolutional neural network
- Input: Configuration, strain and load
- Output: Mean friction, maximum friction, contact area, porosity, rupture, rupture strain

**Figure:** Illustration of the convolutional network architecture for the VGGNet-16 network. Reproduced from [10].

# Kirigami configuration search

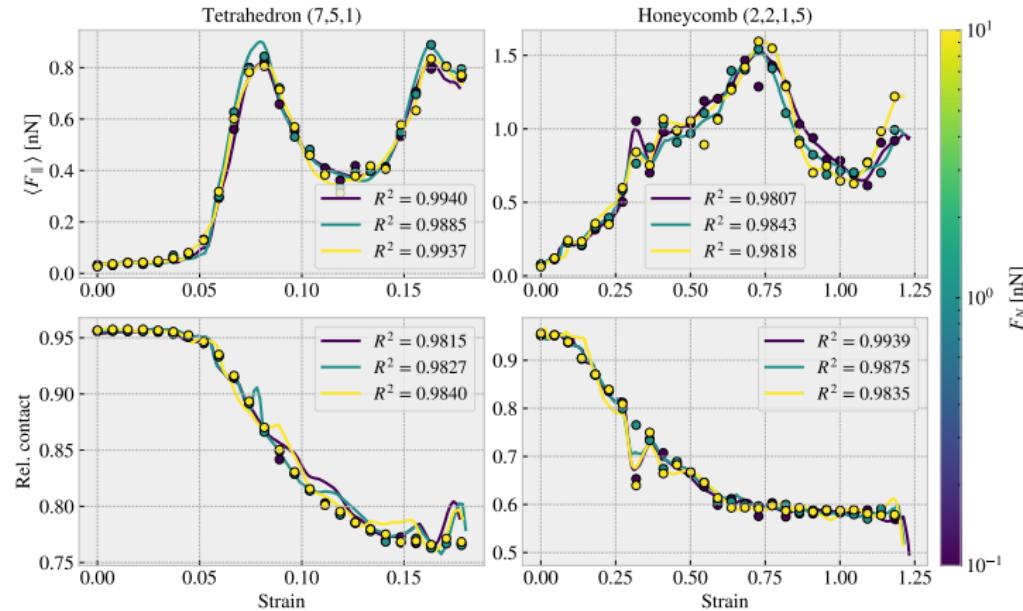

ML

Table: Evaluation of the final model performance.

	$R^2$ [10 <sup>2</sup> ]		Abs. [10 <sup>2</sup> ]	Rel. [10 <sup>2</sup> ]	Acc. [10 <sup>2</sup> ]	
	Mean $F_f$	Max $F_f$	Contact	Porosity	Rup. Strain	Rupture
Validation	98.067	93.558	94.598	2.325	12.958	96.102
Tetrahedron	88.662	85.836	64.683	1.207	5.880	99.762
Honeycomb	96.627	89.696	97.171	1.040	1.483	99.111

## Translational variance

(a) Tetrahedron (1, 7, 1) (60). Std = 0.08, Rel. Std = 1.13

(b) Tetrahedron (5, 3, 1) (60). Std = 0.13, Rel. Std = 1.61

**Figure:** Prediction of the max drop property for selected patterns using the machine learning model for all unique reference positions.

# Kirigami configuration search

## Accelerated search

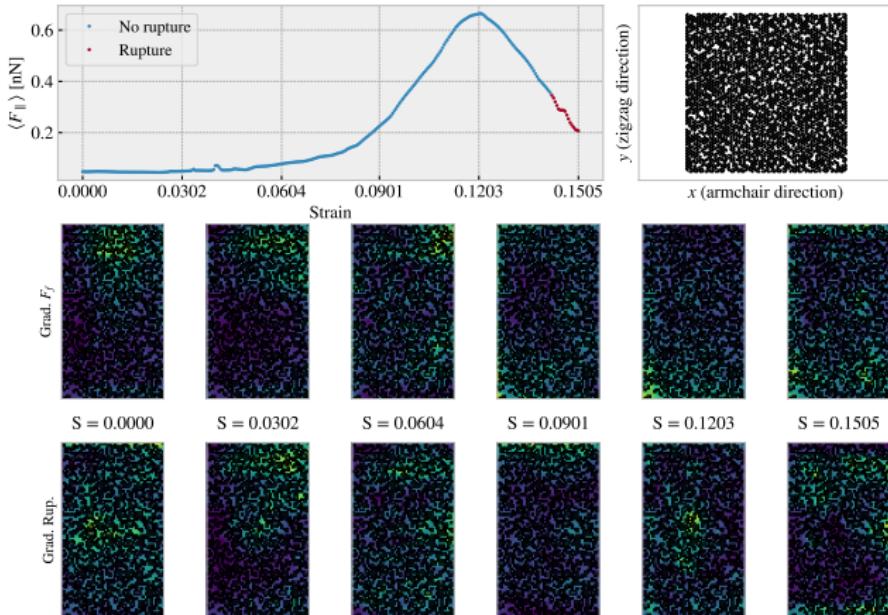

Genetic algorithm based on Markov chain probability.

- ① Rank configurations by fitness score.
- ② Assign a mutation probability based on the ranking.
- ③ Calculate target states from the best candidates.
- ④ Mutate and repeat.

Poor convergence on the mac drop property optimization

## ⑤ Summary and outlook

# Summary and outlook

## Key findings

- Non-monotonous relationship between friction and strain
- Coupled system can be exploited to achieve a negative friction coefficient
- Machine learning is feasible but more data is needed

## Further studies:

- Investigation of the underlying mechanism
  - Commensurability hypothesis can be investigated by varying scan angle
- Friction-strain relationship at different physical conditions: temperature, sliding speed, spring stiffness.
- Edge and thermostat effects.
- Improve dataset with active learning
